## **DETAILED ACTION**

### ***Election/Restrictions***

1. Restriction to one of the following inventions is required under 35 U.S.C. 121:
  - I. Claims 1-16 and 29-34, drawn to direct memory access system and methods, classified in class 710, subclass 22.
  - II. Claims 17-22, drawn to a memory system, which includes the particulars of multiple bus architecture, classified in class 710, subclass 307.
  - III. Claims 23-28 and 35-37, drawn to method and system for memory refresh, classified in class 711, subclass 106.

The inventions are distinct, each from the other because of the following reasons:

2. Inventions II and I are related as combination and subcombination. Inventions in this relationship are distinct if it can be shown that (1) the combination as claimed does not require the particulars of the subcombination as claimed for patentability, and (2) that the subcombination has utility by itself or in other combinations (MPEP § 806.05(c)). In the instant case, the combination as claimed does not require the particulars of the subcombination as claimed because the memory access system and method comprises a programmable scheduler for prioritizing data transfers over the programmable direct memory access data channels are distinct from the subcombination of a multiplexer coupling a plurality of buses having different widths and using a memory as buffer and does not requires the particulars of the subcombination as claimed. The subcombination has separate utility such as in general data transfer using the claimed bus architecture.

3. Inventions III and II are related as combination and subcombination. Inventions in this relationship are distinct if it can be shown that (1) the combination as claimed does not require the particulars of the subcombination as claimed for patentability, and (2) that the subcombination has utility by itself or in other combinations (MPEP § 806.05(c)). In the instant case, the combination as claimed does not require the particulars of the subcombination as claimed because “the method of memory refresh comprising periodically refreshing a portion of the dynamic random access memory less than its predetermined capacity and additionally comprising adjusting a refresh rate of the dynamic random access memory based on ambient temperature to reduce power consumed as the memory portion is refreshed” not required in the combination for patentability. The subcombination has separate utility such as in general data transfer using the claimed bus architecture.

4. An attempt to contact the attorney of record, Mr. Michael Soldner, Reg. No. 41,455 at (847) 523-2585 on March 5, 2003 but did not result in an election.
